WHY IS ALTIS 'SIMPLY THE BEST'

Altis is a patented system with a long history of success. Altis is constantly being tested and upgraded. We are already working on the next improvements which will undergo rigorous testing before presentation to the market.

Altis was the first reticulation system to gain chemical label approval in Australia using systems testing developed by the CSIRO.

Such is the quality and commitment of Altis that we have been able to achieve the Certificate of Conformity under the CodeMark system, which is the highest standard of excellence that can be achieved in Australia. Altis is one of a very small number of building component systems that has achieved this outstanding recognition.

THE ALTIS SYSTEM DIFFERENCE

Many systems are on the markets which have a simple hole drilled into the pipes, but Altis has scientifically designed and regulated delivery points (emitters) which ensure the correct amount of chemical is delivered to all areas being treated. The Emitters ensure grit from soil will not enter, or termites do not make their entrance into the pipe through simple holes.

Tests using a non-repellent termiticide show that over a 50 metre distance there is complete and even distribution over the entire length of the system. No other system can match these results. To further ensure even spread a perforated plastic sheet of builders membrane is employed so that there are two methods that contribute to the even distribution.

Because the Altis pipe is a flat section pipe there is no impression left on the underside of concrete slabs which can weaken the slab. The Altis pipe cannot crush as it does not start life as a round pipe.

Altis has an engineer's report confirming that Altis operates effectively in CLAY even if clay subsidence occurs.

Should there be any question of the soils ability to absorb chemical or as extra precaution where circumstances require, foaming techniques can be applied.

The Altis system is simple to install which is important in the elimination of onsite mistakes.

Altis has recently trademarked Purple in Australia when used in the Altis System. The purple colour identifies the Altis pipe as high density, flexible, resistant to solvents used in Termiticide, manufactured in the unique flat section that fills out under pressure, with emitters which evenly disperse termiticide under low pressure. All materials have been tested to the world wide recognized American Standard testing system for resistance to solvents and long life of 50 years plus under soil.

And above all we are a long established company with hundreds of thousands of successful installations since 1995.

TRAINING & SUPPORT

All installers must be trained to be able to use the Altis Reticulation System. This program is undertaken with every new licensee and any subsequent employed installers. Training courses are held regularly and if you have new employees, there is no additional charge to have them trained at an organised training session.

COST INVOLVED

If you would like to become an accredited company, then the initial cost is currently \$550.00 (including GST) for the licence fee and training.

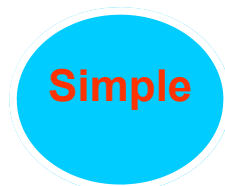

This assists us in covering the maintenance of Altis accreditations and compliance with building regulations.
